

IAMBE Workshop

In connection with AIMBE Annual Event, the International Federation of Medical and Biological Engineering, an affiliate of the International Federation of Medical and Biological Engineering, held on February 20 its second workshop in a series of three. These have focused on the “Future of Medical and Biological Engineering,” and from the first two workshops it is clear that there will be an expanded range of opportunities for the field in the future. These will be due to the convergence of information technology and nanotechnology with continuing advances in biology. Included will be areas ranging from regenerative medicine to home health care, and as we move further into the future there will be as many applications outside of the medical field as within it. The third and final workshop in this series will be held in Munich, Germany in Fall 2009 in connection with the World Congress on Medical Physics and Biomedical Engineering. After which a report will be issued.
